## **Abstract**

Universiti Malaysia Sarawak (UNIMAS) has been involved in ICT for Rural Development research projects since 1999, starting with eBario, a telecentre implemented to provide equal access to information and communications technologies (ICTs) to a rural and remote community, in Malaysian Borneo. Employing a holistic, multi-sectorial, multi-disciplinary and participatory approach, eBario has delivered significant socio-economic changes to the Kelabits, an indigenous group living in Bario. The eBario model has been replicated to four other indigenous communities, also in remote and rural locations in East Malaysia, as well as to four other Orang Asli sites in West Malaysia. Two of the exemplary projects, eBario and eLamai, demonstrate the ripple effects of the participatory approach in generating diverse research and innovation opportunities in areas of anthropology, renewable energy, indigenous knowledge conservation, indigenous tourism, and handicraft making. These projects, implemented by the Institute of Social Informatics and Technological Innovations, UNIMAS, demonstrate how research and innovation in ICT for development projects can create pathways to academic and socio-economic impacts as well as shape policies which govern the deployment of ICTs to underserved communities in Malaysia.

## **Foreword**

The dawn of the information society heralded a wave of optimism around the impact that Information and Communication Technologies (ICTs) would have on the world's social and economic development; not the least in Malaysia at a time where the technologies were extolled in pop-songs and promoted as the basis for the Nation's bold ambitions towards Vision 2020. As academic researchers, we are required to closely examine such claims, to question their veracity and their applicability to the variety of contexts that constitute wider society. It was in 1998 with these thoughts in mind when I first stepped foot in Bario in the remote and isolated Kelabit highlands of Sarawak in the middle of Borneo with the simple question, "How can ICTs be put to good use here?"

Professor Yeo ably answers that question in this publication. From its inception as an admittedly wild idea, what became the eBario project - along with its spinoff initiatives - has pioneered a pathway towards the realisation of the full promise that the information society holds for isolated and underserved communities everywhere, especially those indigenous minority groups whose development needs and aspirations often differ from those of mainstream society. Through its ground-breaking research, the UNIMAS-ISITI team, under Alvin's capable and inspiring leadership, has assembled a formidable body of knowledge that can be put to good use in empowering such communities towards the identification and realisation of their own development priorities through the targeted deployment of ICTs. The effects of the research that Alvin modestly describes here as "ripples" can be more accurately characterised as waves; impacting as they do the wider areas of professional practice and policy formulation that are so often beyond the scope of research that typically emanates from universities.

It is now evident that what happens as a result of ISITI's research in, say, Long Lamai, a tiny remote and isolated settlement deep in the heart of the Borneo rainforest, has relevance for other similar communities in far distant lands – across the rest of Asia, Africa and

Latin America where small underserved indigenous groups encounter the same struggles to maintain their cultures and to engage with the 21st century on their own terms. The technologies that urbanites take for granted within our daily communication needs have far greater relative significance for such peoples living in remote isolation, provided they are introduced in a manner that is sensitive to their potentials and limitations; along the lines that Alvin describes in this important and timely publication.

Why is this document important now? The world is belatedly acknowledging the contribution that the traditional knowledge and wisdom of indigenous peoples can make in sustainably managing the global environment. Indigenous knowledge has been shown to be capable of contributing considerably to a better understanding of climate change and its impact on fragile eco-systems as well as providing important insights into the adaptation methods that can mitigate its effects. For such knowledge to achieve the fullest potential of its contribution towards global development that is sustainable, ICTs will inevitably be deeply implicated and they will be introduced along the lines described here.

## **Acknowledgements**

Firstly, I would like to express my sincere gratitude to UNIMAS Vice Chancellor, Prof Dato' Dr Mohamad Kadim Suaidi, for his continuous support of ISITI's endeavours. I would like to sincerely thank (Past and Present) Deputy Vice Chancellors, Assistant Vice Chancellor, RIMC Directors and Deputy Directors, Faculty and Centre Deans and Deputy Deans, Directors, Heads and Deputies at Finance Division, Registrar's Office, Legal Unit, and Sebayor Holdings for the support of ISITI's efforts and guidance through the intricate procedures required of us. A big thank you also goes to Faculty of Computer Science and Information Technology (FCSIT) Dean, Dr Johari Abdullah, my FCSIT colleagues, in particular the Information Systems Department.

To former CoERI Directors, former UNIMAS Vice Chancellor, Prof Datuk Dr Khairuddin Ab Hamid, and Prof Dr Peter Songan, deepest appreciation for the mentorship and trust placed in me to lead CoERI, and later ISITI; sincere thanks to Professor Dr Narayanan Kulathuramaiyer, for all the guidance and advice, and selecting me to join the eBario Project.

To all ISITI Research Fellows (Past and Present), TPOA and partner researchers; ISITI is where it is today because of your passion, your hard work and dedication. In particular, heartfelt thanks to Assoc Prof Dr Poline Bala (for your unwavering support and tutelage), Dr Mohd Faisal Syam, Dr John Phoa, Assoc Prof Dr Gusni Saat, for teaching me what (and what not) to do in working with indigenous communities. To the ISITI Research Group and Project Heads, Associate Professors: Dr Poline Bala, Dr Lo May Chiun, Dr Souba Rethinasamy, Dr Al-Khalid Othman, Dr Tan Chong Eng, Dr Jane Labadin, Dr Fitri Suraya, Dr Norazila Abd. Aziz, Dr June Ngo; Dr Jacey-Lynn Minoi, Dr Edwin Mit, Dr Cheah Wai Shiang, Prof Dr Raili Suhaili, Dr Chin Saw Sian; not forgetting Nazri Khairuddin, Dr Hushairi Zen, Jayapragas Gnaniah, Dr Wan Azlan, Abang Azlan, Lau Sei Ping, Dr Sarah Flora, and Dr Martin Anyi for going the extra mile.

I would like to thank the Bario Community in particular, Cr. John Tarawe (for showing me the ropes in community engagement and

mobilisation), Late Pemanca Ngimat Ayu and Former Penghulu Henry Jala (for teaching me the true meaning of leadership), Pemanca Philip Lakai, Penghulu Robertson Bala, Bario Longhouse Headmen, Lucy Bulan, Dora Tingan, Jenette Ulun, Gerawat Nulun, Nancy and Harris, Yew Kok Wing, Stephen Bala, Scott Apui, David Labang; eBario and Bario Radio Volunteers: Millie Balang, James Tarawe, Late Jaman Riboh, Florence Apu, Stanley Isaac, Connie Aping, Lucy Terang, Rurum Kelabit Sarawak, Dato Gerawat Gala, Dato Isaac Lugun, and all those who helped and supported us.

Jian Kenin (thank you) to the Long Lamai community, in particular the Council of Elders, Headman Wilson Bian Belare, Telecentre Manager Garen Jengan, Ezra Uda, Gayut Lim, and Diana Azlyn; I have learnt so much from you all despite the few trips I have made there, Long Lamai thrives because of you.

To all DAGS's Telecentre Managers and local champions, Garen Jengan, Edwin Meru, Irene Kodoyou, Tuan Haji Abdul Rahman, PIIM Managers and Assistant Managers in Bau, Kedah and Perlis, my gratitude to you for your efforts in sustaining the telecentres.

I would like to thank MAXIS Bhd for the collaboration and partnership, in particular, Tuan Haji Mohd Nizam Abd Karim (for willing to give UNIMAS the opportunity to show what we can do), Koh Leng Hong (for his continuous support and "troubleshooting" assistance). My sincere thanks also to Dr Yuji Inoue, Dr Hideyuki Iwata (both from TTC), Mike Khaw and OSEAN, Engineers Without Borders, PANGAEA, Azmi Noordin, Noorly Iza, Zulkaperi Haji Manan, Rosalmah Othman, Salmah Ahmad, NERA Infocom (M) Sdn Bhd, Sprintz Designs Sdn Bhd, Embedded Wireless Labs Sdn Bhd, and Ericsson Malaysia.

I am grateful to Tanoti and Jacqueline Fong for helping to brand, promote and sell the Long Lamai handicrafts.

To the international and national advisors of ISITI, Professor Dr Tim Unwin, Professor Dr Russell Beale, Dr Michael Gurstein, Prof Dr Roger Harris, Pn Azizah Hamzah, Dato Hj Affandi, Lelia Sim Ah Hua, and Dato Gerawat Gala, a big thank you.

I would like to thank our collaborators for their trust and continuous support: Prof Dr Heike Winschiers-Theophilus, Assoc Prof Dr Beryl Plimmer, Sir Brian Heap, Dr Bernie Jones, Dr John Holmes, Dr Terry van Gevelt, Amy Kuo Somchanhmavong, and Shorna Broussard Allred.

I am indebted to: ISITI's Administration staff, Pn Elizabeth Etta, Yusri Jumat, Pn Bunia Samiran, Pn Norisa Mohamad Sahari, Pn Halluyah Muhd Ali, Pn Nor Safura Mahari, En Din Abdullah, En Zaki Sharkawi; my efficient, tireless and multi-tasking post-doc, Dr Tariq Zaman; and the energetic and ever ready Centre for Rural Informatics' staff, Gary "Superman" Loh, Teh Lee Na, Ng Koh Ping, Farina Osman, Ismail Jolhip, Jaya Laxshmi, Pn Lili Azizah, Justin Peton, Elise Wong, Siti Zuraina Jedi, Enix Goh, Ian Voon, Cynthia Sim; interns Hasnain Falak, Lai Chiu Ting, Kassie Teo, Wellingson ak Kuling, Azwan Kajang, Farhanah Aliqah Norki, Rabial Adawiyah, Matthew Kallang Ding, and Franklin George.

Thank you to Assoc Prof Dr Tan Chong Eng and Assoc Prof Dr Jane Labadin for the ICT4D discourse, and keeping ISITI moving especially during my travels.

To Professor Dr. Roger Harris, for his contribution as ISITI's think-tank, his golden touch strategies, support and guidance, my sincerest and humblest thank you!

Finally, to my Mum, wife, children, siblings; thank you for the sacrifices made and putting up with my infinite field trips and travelling.

PROFESSIONAL LECTURE SERIES (INAUGURAL LECTURE)

# **Leveraging Research and Innovation in ICTs for Socio-Economic Development**

by

Alvin Yeo Wee  
Institute of Social Informatics & Technological Innovations  
Universiti Malaysia Sarawak  
94300 Kota Samarahan, Sarawak  
MALAYSIA

## **1 ICT for Development**

It is generally acknowledged that providing access to Information and Communication Technologies (ICTs) for rural and remote communities can assist in alleviating poverty as well as improving their socio-economic status. This utilisation of ICTs to bring about development is covered under the term, ICT4D (Information and Communication Technologies for Development). Among the numerous benefits of having ICT access include giving access to unlimited information resources for teaching and learning (e.g. eLearning), providing health related services (telediagnosis), increasing employment and business opportunities (eCommerce), and access to government services (eGovernment websites) (Siew, Yeo & Zaman, 2013). There is also evidence to suggest that rural dwellers gain more benefit than urban dwellers from any increase in access to ICTs (ITU, 2010), but

the absence of relevant experience, local content and skills are major barriers for rural ICT usage (Gurstein, 2003; Pringle & David, 2002).

Typically, the more difficult the geographical locations, the higher the financial costs of setting up and providing ICT access to such areas. Adding to these challenges, remote areas typically do not have mains power or telecommunication access. As such, the access to ICTs is delivered through telecentres (also known as ICT access points, Internet centres, community broadband centres, knowledge centres). Telecentres are similar to cybercafés except that, unlike in urban areas, the telecentre is managed for the community, by the community for the purpose of local development. Telecentres can be run by either public, private individual(s), or both, for public consumption. In this monograph, the term *telecentres* refers to any centre or facility whereby the community is able to access ICTs and use the Internet or services provided for the purpose of stimulating local development.

Given the importance of the telecentre as a means to provide ICT access to rural communities, UNESCAP (2007) indicated that over half a million telecentres are needed in order to serve its expanding population. In Malaysia, there are several initiatives with this aim, including *Medan Info Desa*, *Pusat Internet Desa*, Community Broadband Centres and *Pusat Internet 1 Malaysia*, run by the various ministries and private entities in Malaysia. At one stage, there were more than 2,500 telecentres in Malaysia.

Unfortunately despite much technological advancement, solutions to problems such as the sustainability of telecentres and scaling-up the deployment of telecentres remain elusive. Other challenges include financial constraints, difficulties in rallying the community's support, building and maintaining telecentres, the monumental task of ensuring sustainability, selection of products and services which address the needs of the community, and the ultimate test of delivering positive change to the community.

This monograph describes a number of research projects located at remote and rural telecentre sites; projects which have been carried out by the Centre for Rural Informatics at the Institute of Social Informatics and Technological Innovations (ISITI), Universiti Malaysia Sarawak (UNIMAS), henceforth UNIMAS-ISITI.

By showcasing these projects' outputs and outcomes, we aim to demonstrate:

- How ICTs have contributed to bringing about socio-economic development
- How ICT4D research projects have benefited the communities involved, the University, State, and the Nation
- How these projects have contributed to the body of knowledge of ICT4D, not just theoretically but also from a practical perspective, in other words, praxis.

We believe that by sharing the reflections conducted, showcasing the experiences and lessons learnt, and by demonstrating the pathways of ICTs to socio-economic development, we can assist academia, Government and industry to improve the way technology is deployed to benefit other underserved communities.

In this monograph, the projects will be presented in approximately chronological order. We start with the eBario Project in 1999, the replication of the eBario Model to four sites in East Malaysia (Demonstrator Application Grants Scheme - DAGS) and then the replication to four sites in West Malaysia (Telecentre Programme for Orang Asli - TPOA). The research findings and knowledge garnered were then used for training of personnel in *Pusat Internet 1 Malaysia* (1Malaysia Internet Centre) run by MAXIS (a telecommunications service provider) under the Universal Service Provision (USP) funding by Malaysian Communications and Multimedia Commission (MCMC). (Please refer to MCMC's website, <http://www.skmm.gov.my> for details on USP and MCMC's role in ICT4D.)

The monograph will specifically showcase selected projects in two sites, namely Bario, and Long Lamai, where a majority of the projects have been implemented.

All the telecentres presented, namely, eBario, DAGS, and TPOA are located in remote and rural areas. In this monograph, we define *rural* as areas with a population of less than 5,000 people. We define *remote* as those areas which we need to travel more than 3 hours (be it by four-wheel drive (4WD), boat or small plane) from the nearest urban centre or town. These remote and rural areas typically do not have 24-hour mains-provided electricity supply nor telecommunication access.

**Figure 1: Paddy fields in Bario**

## **2 Bario and eBario**

Bario is a remote rural community located in Malaysian Borneo. It is situated close to the Sarawak (Malaysian) Kalimantan (Indonesian) Border. Flying to Bario on a 19-seater Viking plane operated by MASwings, is the only practical way to get there. In 1999, there was no road access, and a land expedition would comprise a river journey and an additional 14-day trek across forested mountains. Today, access by land is via a 14 to 18 hour journey by 4WD on logging road from Miri, the nearest urban centre.

Bario comprises 12 longhouses, which are home to more than 1,000 people. The majority of the Bario population are Kelabits, one of the smallest ethnic groups in Sarawak. The Kelabits in Bario are predominantly farmers planting the fragrant and famous Bario rice (see Figure 1).

### **2.1 eBario Project**

UNIMAS initiated the eBario Project as a study to determine how ICTs can improve the lives of a rural community. The researchers conceived the idea of bringing the Internet to Bario as a research project to ascertain opportunities for social development available from the deployment of ICT within remote communities in Sarawak. Promising results from studies in other developing countries convinced the team to work with these communities in Sarawak to give them equal access to ICTs, specifically the Internet, with the expectation of providing significant improvements to the community's lives.

eBario's objectives include the following:

- To define the extent to which contemporary ICTs could deliver sustainable social and economic development to the lives of the remote rural communities

- To identify further needs and opportunities within such communities that can be satisfied by the innovative use of contemporary ICTs
- To demonstrate how significant and sustainable development can be achieved by remote communities

Why Bario? In 1999, while there were many communities in Sarawak that satisfied the criteria of a rural remote location, Bario was selected because of its extreme remoteness. In addition, back then there was minimal basic infrastructure (no 24-hour electricity supply and no telecommunication service). Given its remoteness, the catchphrase was that if you could successfully implement such a project in Bario, you can do so anywhere.

Participants in the eBario project comprised a multidisciplinary research team from UNIMAS, the Bario community, Government, industry, and the primary and secondary school in Bario.

We at UNIMAS-ISITI recognise the pioneers of eBario, from UNIMAS: Prof Dr Roger Harris (who initiated the idea of eBario), Associate Prof Dr Poline Bala (eBario site leader), Prof Datuk Dr Khairuddin Ab Hamid, Prof Dr Peter Songan, Bario community: Pn Lucy Bulan (then Principal of the Bario Secondary School) and Cr. John Tarawe (now Councillor at Marudi District Council).

Prof Dato' Zawawi Ismail, the then UNIMAS Vice Chancellor, supported the project and situated it under the eLearning and eCommunity component of the Malaysian National IT Council Agenda. Initial funding came from the International Development Research Centre (IDRC) of the Canadian Government, and the Malaysian Government Demonstrator's Application Grant Scheme (DAGS). The project received a funding of USD 213,000 (about USD 213 per person in Bario) of which 13% went to transportation costs; everything (computers, satellite dish, furniture, batteries, solar panels) then had to be flown in.

## 2.2 Implementation

By 2001, the Bario Secondary School was equipped with a computer laboratory and Internet access. In 2002, the telecentre (see Figure 2) opened, equipped with 10 computers and Internet access. Internet connectivity was via a Very Small Aperture Terminal (VSAT) satellite communication system. The research team had organised computer literacy train-the-trainer training prior to the deployment of the ICTs. Participants then included members of the community, teachers, and secondary school students.

Participatory Action Research (PAR) was chosen as the research methodology for the project. It was deemed necessary that:

- the researchers should learn about life in Bario from the community;
- the community should learn about ICTs from the researchers;
- community members should perform major portions of the research;
- the researchers should be able to identify with the community; and
- as a team, the community researchers should be capable of achieving mutually beneficial outcomes from the project by reflecting on iterative cycles of action (Bala, Harris & Songan, 2003).

**Figure 2: Opening of eBario Telecentre**

### **2.3 Initial Use of Telecentre**

At the telecentre, the main users were the tourist lodge operators who used email to communicate with their potential clients, and members of the various committees in Bario who used wordprocessors to type up the minutes of meetings or official letters.

The more senior community members were also indirectly using emails; a staff member at the telecentre acted as the intermediary to access their email accounts. The senior citizens were reported to be keen users of email given that they were able to keep in touch with their families living outside Bario, and could see their grandchildren's photographs (Bala, 2011). The telecentre charged both the locals and visitors for the use of the computers. The collection per month ranged between USD160 and USD266 a month. Given that the telecentre is run by volunteers, and used solar power to run the computers, this collection is considered the first step towards achieving a sustainable model.

### **2.4 Impact of eBario**

With the community's access to ICTs, there was increased computer literacy among the students, teachers and community. According to Lucy Bulan, the then Bario Secondary School Principal, "*... rural students always started at a disadvantage when they left Bario*" but with the ICTs access, they were able "*... to bridge the gap between the shy, unexposed students and their aggressive, well informed counterparts in town*". In other words, when the students in Bario go to Miri or Marudi to continue their studies; they would be just as adept as their urban counterparts at using computers. The community is now able to communicate with the rest of the world. Examples of noticeable improvements include improved communication between Bario and the respective government headquarters, as well as emergency calls for assistance with the Internet or public telephone.

eBario also played an important role as the communication centre for a search and rescue operation near Bario in July 2004. The search and rescue operation for a missing helicopter which was conducted over 12 days, involved the Police, Military, Royal Malaysian Air Force and their allies as well as locals. This massive operation required much coordination and communication in the remote location. With eBario, the search and rescue operation had access to phones, fax, and the Internet, where timely press releases and reports were made available.

## **2.5 Leveraging on Natural Assets**

The people in Bario are very hospitable. Bario is also steeped in culture (see Figure 3) and has wonderful nature treks, nice cool weather and great sceneries. As such, the biggest impact of eBario was on the tourism industry. Prior to eBario, bookings were made in the form of letters, or information brought by people flying into Bario. Lodge operators capitalised on the communication access and were now able to liaise with their potential clients directly via email and promote their tourist services online. The increase in tourists resulted in enhanced employment opportunities, which further translated to more revenue for the community. In addition, more youths and their families were staying back in Bario to operate the accommodation and tourist activities. In 1999, there were 2 homestays, 10 in 2006, and today, there are more than 20 homestays. Another indication of increased visitors is the frequency of flights into Bario; in 1999, there was only one flight a day. In 2003, the number of flights increased to 2 flights daily, and today there are 3 daily flights into Bario.

In 2007, we conducted a survey of the number of visitors (as recorded in the lodge's visitor books) from year 1997 to 2006 (see Figure 4). We believe this increase in visitors was attributed to the Internet connectivity provided by the telecentre. The positive effect of the telecentre on tourism was supported by a study (Lo et al., 2013a).
