DECLARATION OF ORIGINAL WORK

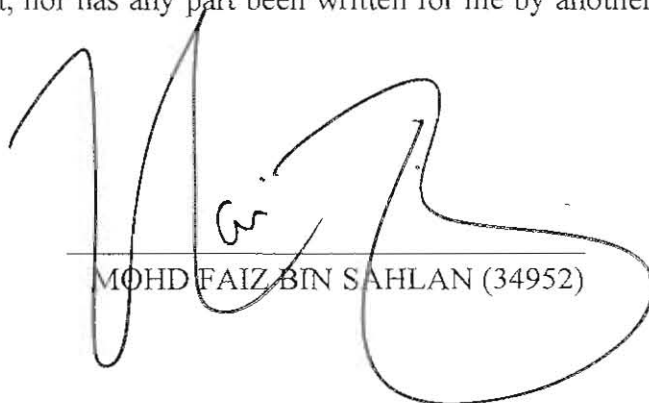

This declaration is made on the 14 day of June 2017.

Student's Declaration:

I MOHD FAIZ BIN SAHLAN, 34952, FACULTY OF ENGINEERING hereby declare that the work entitled RASPBERRY PI ASSET LOCATION TRACKER is my original work. I have not copied from any other students' work or from any other sources except where due reference or acknowledgement is made explicitly in the text, nor has any part been written for me by another person.

14/06/2017

Date submitted

MOHD FAIZ BIN SAHLAN (34952)**Supervisor's Declaration:**

I, MARTIN ANYI hereby certifies that the work entitled RASPBERRY PI ASSET LOCATION TRACKER was prepared by the above named student, and was submitted to the "FACULTY" as a * partial/full fulfillment for the conferment of BACHELOR OF ENGINEERING (HONS) IN ELECTRONICS (TELECOMMUNICATIONS), and the aforementioned work, to the best of my knowledge, is the said student's work.

Received for examination by:

(DR. MARTIN ANYI)

Date:

14/6/2017

I declare that Project/Thesis is classified as (Please tick (✓)):

☐ **CONFIDENTIAL** (Contains confidential information under the Official Secret Act 1972)*

☐ **RESTRICTED** (Contains restricted information as specified by the organisation where research was done)*

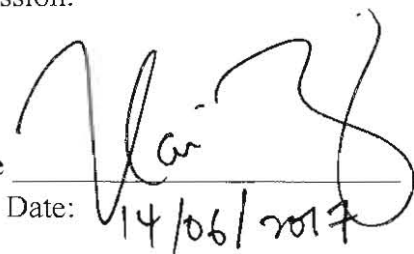

☒ **OPEN ACCESS**

Validation of Project/Thesis

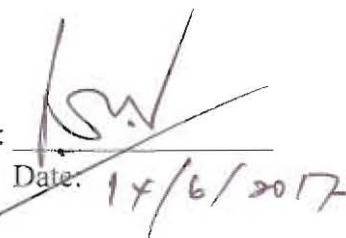

I therefore duly affirmed with free consent and willingness declare that this said Project/Thesis shall be placed officially in the Centre for Academic Information Services with the abiding interest and rights as follows:

- This Project/Thesis is the sole legal property of Universiti Malaysia Sarawak (UNIMAS).
- The Centre for Academic Information Services has the lawful right to make copies for the purpose of academic and research only and not for other purpose.
- The Centre for Academic Information Services has the lawful right to digitalise the content for the Local Content Database.
- The Centre for Academic Information Services has the lawful right to make copies of the Project/Thesis for academic exchange between Higher Learning Institute.
- No dispute or any claim shall arise from the student itself neither third party on this Project/Thesis once it becomes the sole property of UNIMAS.
- This Project/Thesis or any material, data and information related to it shall not be distributed, published or disclosed to any party by the student except with UNIMAS permission.

Student signature

Supervisor signature:

Date: 14/6/2017

Current Address: Pangsapuri Hospital No 9 - 102, 89000 Keningau, Sabah

Notes: * If the Project/Thesis is **CONFIDENTIAL** or **RESTRICTED**, please attach together as annexure a letter from the organisation with the period and reasons of confidentiality and restriction.

[The instrument is duly prepared by The Centre for Academic Information Services]

RASPBERRY PI ASSET LOCATION TRACKER

MOHD FAIZ BIN SAHLAN

A dissertation submitted in partial fulfillment
of the requirement for the degree of
Bachelor of Engineering (Hons) in Electronics
(Telecommunications)

Faculty of Engineering
University Malaysia Sarawak

2017

Thank You Allah, All praises to Him,

*Special thanks to our dedicated lecturer Dr Martin Anyi for guidance and advice regarding
our final year project II, thank you Dr.*

Dedicated to my beloved parents and family. I love your soul.

To the people of Levant, every hardship comes ease. ..

Dear beloved khadee'ja, when the love for the sake of Him, it doesn't end.. .

ACKNOWLEDGEMENTS

The author would like to thank Allah for the ability He has bestowed upon us to do all the things in life. Special thanks to the lecturer and project supervisor, Dr. Martin Anyi for their invaluable guidance, motivation, technical advices and moral support throughout the time completing of this FYP II. The author would like to convey his utmost gratitude to his parents family and loves ones for their endless support and understanding throughout this semester. Finally, the author would like to thank all the lectures who support or gives an idea regarding this project. With them, the completion of this project is makes possible.

ABSTRACT

This project is to design the tracking system using the Raspberry Pi platform where it is utilize the available hardware and the software. The basic method of this project is using the concept of the Internet of Things (IoT). In order to implement the concept, the application of SSH PuTTY and Dweet.io are applied in this project as well as the weaved.com as a Rasbian OS server. Furthermore, it is using the Python language, ConnectBot, Google Play, Screen Recorder, Google Web Browser and Sakis3G to support the implementation of the system. As the software is complete setup, the hardware requirement for this project are the microcontroller where the project using the Raspberry Pi model B+, Huawei ZTE modem MF 190, BU-353 GPS, SIM card and Android Smartphone. As result, the system is successfully tracking the asset as desired. Hence, the implementation of the system is success and for the future scope is suggested to implement with local database as well as applied a hidden camera and VOIP to enhance the capability of the system.

ABSTRAK

Projek ini adalah untuk mereka bentuk sistem pengesanan menggunakan platform Raspberry Pi di mana ia menggunakan perkakasan dan perisian yang sedia ada. Kaedah asas projek ini menggunakan konsep Internet untuk Semua Perkara (*IOT*). Dalam usaha untuk melaksanakan konsep ini, penggunaan *SSH PuTTY* dan *Dweet.io* digunakan dalam projek ini dan juga *weaved.com* dalam sistem operasi *Rasbian*. Tambahan pula, ia menggunakan perisian bahasa *Python*, *ConnectBot*, *Google Play*, *Screen Recorder*, Pelayar Web *Google* dan *Sakis3G* untuk menyokong pelaksanaan sistem. Perisian adalah persediaan lengkap untuk keperluan perkakasan untuk projek ini dan pengawal mikro itu adalah menggunakan *Raspberry Pi model B +*, *Huawei ZTE modem MF- 190*, *BU-353 GPS*, kad *SIM* dan telefon pintar *Android*. Hasilnya, sistem ini berjaya mengesan aset seperti yang dikehendaki. Oleh itu, pelaksanaan sistem ini telah berjaya, dan untuk skop masa akan datang dicadangkan untuk melaksanakan dengan pangkalan data tempatan, kamera tersembunyi untuk meningkatkan keupayaan system dan komunikasi atas talian menggunakan *VOIP*.

CHAPTER 1

INTRODUCTION

1.1 Introduction

In these section, will be presented the background of the project, the problem statements of the project, the objectives of the project, the scope of works for the project and the project outlines.

1.2 Background of the Project

This project is focus on the Raspberry Pi Asset Location Tracker where it using the Raspberry Pi (RPi) model B as a main micro-controller platform, the Global Positioning System (GPS) as a signal location tracker module which is the BU353 GPS model, HUWEI ZTE MF190 model for the Global System for Mobile communication (GSM) modem, 5 voltage (5V) power bank as the RPi Asset Location Tracker power supply and the liquid crystal display (LCD) for the users to interact with the system such as mobile or personal computer (PC). Furthermore, the software are using the Linux family operating system (OS) such as Raspbian, Python as the command language between the system and the Secure Shell (SSH) as a cryptographic network protocol for the operating network services securely over an unsecured network such as online server. The online server that this project been used is the Weaved.com online server where it remote the system through internet.

RPi Asset Location Tracker is about a system that capable to track the location of a moving asset. For example, the asset for this project is the commercial vehicle such as VIVA from Perodua manufacturer. The location of the asset traced from the GPS module where the GSM modem as the communication media for the RPi and the PC. Basically, the project started with reviewing the previous study that has been done. There are 9 selective journals that have been reviewed for the understanding of the system cognition as a tracking platform, hardware and software that been used, the result of the studies been done and most important is the problem statement that yet be done. Last but not least, to compare the capability of the previous study with the current technology as well as the methodology been used.

1.3 Problem Statements of the Project

Vehicle theft is a major problem that Malaysian faced nowadays. Based on the statistic from the General Association of Malaysia (2016) (refer to Appendix E), an average of 60 vehicles gets stolen every day from over the countries. Although, the vehicles fully equip with the advance security system but the cases increased and Malaysia said to be ranked as one of the top 10 countries in the world with the highest number of vehicle theft. Based on Sarawak Borneo post, number of vehicle stolen in Sibu increased (refer to Appendix E). Toyota Hilux always became a target for thief. Sibu is not safe for vehicles such as Toyota Hilux even it is equipped with sophisticated car security system. So this kind of matter could be solved by using tracking devices which resides inside the car to be traced.

Therefore, the system should be separated from the main system which is the vehicle and develop the backup system which is tracking device. Furthermore, RPi Asset Location Tracker is a stand-alone system that yet been done in Malaysia, especially. As it is a stand-alone system, it considered as a personal asset security system and one of the innovative solution to overcome the vehicle theft as well as to get back the stolen vehicle easily due to the location tracker reside in the user vehicle.

1.4 Objectives of the Project

The project is presented in the Final Year Project II (FYP II) where it is aimed to design the tracking system using RPi platform in order to access the location of the vehicles. The application of 'Internet of Things' is useful so that the RPi could be accessed around the world, as long as the internet coverage is connected. Furthermore, the communication between the users and the system is using the Python programming interface. Hence, to utilize the hardware and the software interfaces which are the GPS module, GSM modem, RPi power bank, and the software are the Raspbian OS, Python, online server application, Sakis3G as well as the SSH application (PuTTY).

The objectives of this project are as followed:

- To design the tracking system using the RPi platform.
- To utilize the hardware and the software interfaces which are the hardware are the GPS module, GSM modem, RPi power bank, and the software are the Linux OS, Python, online server application, as well as the SSH application.
- To apply the concept of Internet of Things.
- To detect the location of the asset (Vehicle) using RPi.

1.5 Scope of Works for the Project

My scope of work for this project is going to design the tracking system using the RPi as a main microcontroller for the system. In order to make the system working, hardware such as the USB GPS module, USB power bank, and the USB GSM modem as the sub-core for the system. Next is to develop the communication platform between the systems with the users by using the software. The software is worked to frame the architecture of the system where it utilized the computer language which this project used is the Python programming. These technologies assembled and deployed the users' location on the terminal command of SSH.

Hence, the scope of work that this project focus on are to design the tracking system using the RPi platform, to utilize the hardware as well as the software applications, to apply the concept of the Internet of Things and most important to detect the asset location. As go through the project, it will illustrate the differences of this project from another project that has been done where in each projects measured by the differences of used the software and the hardware as stated in this chapter.

1.6 Project Outlines

As summary for the Chapter 1, the project outlines are divided into 5 chapters which are introduction, literature review, methodology, result and discussion, and the conclusion as well as recommendation.

Chapter 1: Introduction

This chapter provides the general overview of the Raspberry Pi Asset Location Tracker, where it included the objectives of the project, the problem statement, scope of work and the project outlines.

Chapter 2: Literature Review

This chapter explain the details about the preliminary study and the basic understanding of the tracking system. This chapter also followed by some example of the existing applied system which having the same concept with the proposed system.

Chapter 3: Methodology

This chapter discussed the methods used to develop the Raspberry Pi (Rpi) Asset Location Tracker system. This section explain more details on development process, software and the components that being used in order to complete the project. At this point also illustrate bench-testing and programming of the system.

Chapter 4: Result and Discussion

This chapter will cover the result of the project and the discussion from the findings as well as previous finding.

Chapter 5: Conclusion and Recommendation

In this chapter, it is the summary and the conclusion of the project where it included the limitation of the project as well as the recommendation for future scope of the applied research.
