DECLARATION OF ORIGINAL WORK

This declaration is made on the 12th day of June 2019.

Student's Declaration:

I, ADARSH PHILIP (51047), DEPT. OF ELECTRICAL AND ELECTRONIC ENGINEERING, FACULTY OF ENGINEERING hereby declare that the work entitled, DEVELOPMENT OF SOLAR POWER SYSTEM FOR SARAWAK PEAT WATER CONTINUOUS ELECTROCOAGULATION TREATMENT PROCESS is my original work. I have not copied from any other students' work or from any other sources except where due reference or acknowledgement is made explicitly in the text, nor has any part been written for me by another person.

ADARSH PHILIP (51047)

Name of the student (Matric No.)

Final Year Project Supervisor's Declaration:

I, DR. NAZERI ABDUL RAHMAN hereby certifies that the work entitled, DEVELOPMENT OF SOLAR POWER SYSTEM FOR SARAWAK PEAT WATER CONTINUOUS ELECTROCOAGULATION TREATMENT PROCESS was prepared by the above named student, and was submitted to the "FACULTY" as a * partial KNC 4344 Final Year Project I course fulfilment for the conferment of BACHELOR OF ENGINEERING WITH HONOURS (ELECTRICAL AND ELECTRONIC ENGINEERING), and the aforementioned work, to the best of my knowledge, is the said student's work

Received for examination by: _____
DR. NAZERI ABDUL RAHMAN

Date: 12 JUNE 2019

I declare this Report is classified as (Please tick (√)):

- ☐ **CONFIDENTIAL** (Contains confidential information under the Official Secret Act 1972)*
- ☐ **RESTRICTED** (Contains restricted information as specified by the organisation where research was done)*
- ☒ **OPEN ACCESS**

Validation of Report

I therefore duly affirmed with free consent and willingness declared that this said Report shall be placed officially in Department of Chemical Engineering and Energy Sustainability with the abide interest and rights as follows:

- This Project/Thesis is the sole legal property of Universiti Malaysia Sarawak (UNIMAS).
- The Centre for Academic Information Services has the lawful right to make copies for the purpose of academic and research only and not for other purpose.
- The Centre for Academic Information Services has the lawful right to digitise the content to for the Local Content Database.
- The Centre for Academic Information Services has the lawful right to make copies of the Project/Thesis for academic exchange between Higher Learning Institute.
- No dispute or any claim shall arise from the student itself neither third party on this Project/Thesis once it becomes sole property of Universiti Malaysia Sarawak (UNIMAS).
- This Project/Thesis or any material, data and information related to it shall not be distributed, published or disclosed to any party by the student except with Universiti Malaysia Sarawak (UNIMAS) permission.

ACKNOWLEDGEMENT

The author would like to express his gratitude to the Department of Electrical and Electronic Engineering and Department of Chemical Engineering and Energy Sustainability, Faculty of Engineering, Universiti Malaysia Sarawak for giving the opportunity to the author to conduct this study. Special thanks and deepest appreciation to Dr. Nazeri Abdul Rahman for his professional guidance on the study, knowledge, and experience sharing as well as advice and recommendations to improve the project. In addition, the author would like to extend his sincere appreciation toward his family and friends for their valuable services and time to help him in completing this study. Last but not least, the author would also like to express his greatest appreciation to God for His mercy and grace to bring hope even the toughest of times, strengthening him for this final year project.

ABSTRAK

Sarawak ialah negeri terbesar di Malaysia yang terdiri daripada penduduk yang bertumpu di kawasan bandar tetapi bertaburan di kawasan luar bandar . Air bersih penting tetapi di beberapa kawasan bekalan sumber air bersih tidak mencukupi di kawasan pedalaman. Bekalan air luar bandar alternatif (Sawas) Sarawak adalah program alternatif dari kerajaan negeri dengan tujuan menyediakan air yang selamat dan bersih ke kawasan luar bandar. Kajian ini terbahagi kepada tiga peringkat. Pada peringkat pertama, kajian ini akan mengkaji kebolehan menggunakan kuasa solar untuk proses elektrokoagulasi untuk rawatan air. Ini termasuk penyiasatan mengenai proses asas elektrokoagulasi serta pelbagai sumber tenaga yang mungkin untuk proses tersebut. Tahap kedua kajian ini akan merancang sistem tenaga suria untuk menyokong proses rawatan air gambut untuk sistem elektrokoagulasi yang sudah dikenalpasti. Ini merangkumi reka bentuk dan fabrikasi sistem kuasa suria berskala kecil untuk sistem yang disebutkan sedemikian. Untuk peringkat ketiga kajian ini, beberapa simulasi dan kajian eksperimen dijalankan pada sistem yang direka untuk menentukan parameter yang optimum untuk sistem. Akhir sekali, projek ini dijangka dapat membangunkan sistem tenaga solar yang sesuai dan boleh ditambah dengan sistem elektrokoagulasi air gambut yang dikenal pasti untuk sistem rawatan air mandiri.

Kata Kunci: Elektrokoagulasi, Sistem Kuasa Solar, Air Gambut, Sistem Rawatan Air

ABSTRACT

Sarawak is the biggest state in Malaysia of which comprising population concentrated in urban area but very scattered in rural area. Clean water is essential but in some area the water supply is inadequate in rural area. Sarawak alternative rural water supply (Sawas) is an alternative programme from the state government to purpose of provide safe and clean water to rural areas. The main aim of this study is to design a solar power system to support Sarawak peat water continuous electrocoagulation treatment process. The study is divided into three stages. In the first stage, the study investigates the viability of utilizing solar power to power the electrocoagulation process for water treatment. This includes investigation on the electrocoagulation fundamental process as well as various possible sources of energy for the process. The second stage of the study is to design a solar power system to support the treatment process of peat water for an identified electrocoagulation system. This includes designing and fabrication of a small-scale solar power system for such mentioned system. For the third stage of this study, some simulation and experimental studies are conducted on the designed system in order to determine the optimum parameters for systems. Lastly, this project is expected to develop a suitable solar power system with can be coupled with an identified peat water electrocoagulation system for a standalone water treatment system.

CHAPTER 1

INTRODUCTION

1.1 Domestic Water

Domestic water is the supply of clean water for activities in household activities. In Malaysia, only 3% of the domestic water supply sources is derived from groundwater while 97% is from the surface water [1]. Indoor usage and outdoor usage are two of the classified main usages of domestic water. For indoor usage, water is used for drinking, showering, cooking and washing dishes as well as clothes. While for outside purposes, water is utilized for watering plants, cleaning drain and washing car. The percentage of consumption of water can be arranged into eight primary classes [2]. **Table 1.1** depicts the typical household water used in the residential area.

Table 1.1 Typical Household Water Usage [2]

Type of Water Usage	Percentage (%)
Toilets	27
Shower	17
Faucet	16
Clothes Washer	22
Other domestics	2
Dishwasher	1
Baths	2
Leaks	13
Total	100

All social and economic endeavors need water as an important element in maintaining life. Abdullah [1] reported in *Malaysia Kini* that the consumption of water by Malaysians per day in 2013 was 210 liters L, and in 2014, the average water consumption raised to 212 L. This shows that malaysian water consumption exceed the recommendation of water consumption by World Health Organisation (WHO) which is 165 L daily.

1.2 Peat Water

Peat is the heterogeneous mixture of partially decomposed plant remains mostly in organic soil. sand, silt, and clay under damp and anaerobic condition. 13% of the Sarawak State's total land area is covered with peat which is approximately 1.7 million hectares, ha [3]. Some community in Sarawak is using peat water as their domestic water supply. In

Sarawak, Sibü division has the largest area covered with peat water in Sarawak [4]. **Figure 1.1** shows the distribution of peatland in Sarawak while **Table 1.2** shows the area covered by peatland in the division of Sarawak.

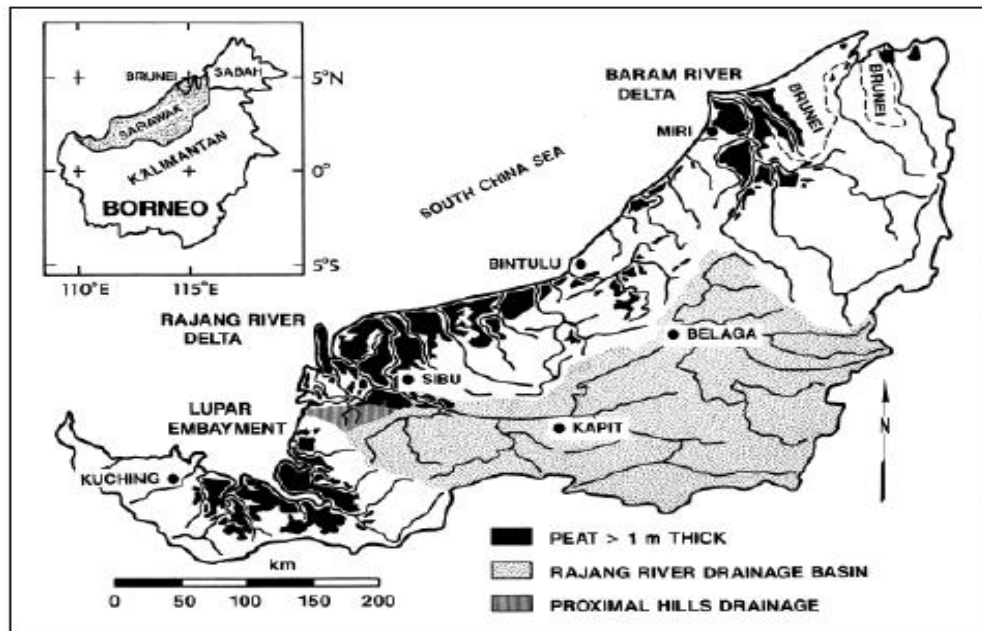

Figure 1.1 The distribution of peat in Sarawak [4]

The complex aromatic compound organic matter known as humic substances which constituent of at least 30% of total matter is a typical peat characteristic in Sarawak [5]. The peat water found in Sarawak is slightly acidic and colored because of the existent of these humic substances [6]. The peat water has a slight yellowish-brown color shading as depicted in **Figure 1.2**.

Table 1.2: Distribution of peat in Sarawak [3]

Division	Area (ha.)

Miri	276, 579
Limbang	25, 300
Total	1, 657, 600

1.3 Water Treatment System

Water treatment can be divided into a few classes which are chemical, biological and physical treatment. Each of these classes has its own purpose in removing various elements

for water treatment [7]. Chemical treatment is a process to treat water with the additions of chemicals. The production of chemical sludge contributes to environmental problems in which making the chemical process less preferable than the other processes [8]. A wide range of microorganism and bacteria are utilized in biological treatment in treating water making it different with chemical processes. One of the common biological treatments is activated sludge process [8].

Figure 1.2 Peat Water

The availability of dissolved oxygen in wastewater influences the type of biological processes as in the case of aerobic, anaerobic or facultative. Filtration, membrane and electrocoagulation are the common physical treatment. Electrocoagulation is a process to remove suspended solids, colloidal material, and metals as well as other dissolved solids from water and wastewaters by mean of introducing electricity process [9]. Electrocoagulation is an electrochemistry process for the removal of pollutants in water treatment. The description of different types of water treatment technologies is stated in **Table 1.3**.

Table 1.3: Types of Water Treatment Technologies [7]

Types	Description	Processes
Chemical	In order to purify the water, additional of chemicals are required to react with the targeted pollutants	Ion exchange, coagulation
Biological	By utilizing the microorganisms for contaminants degradation, the biological treatment processes mainly remove the organic contents and nutrients in wastewater.	Activated sludge, trickling filters
Physical	Additional chemicals are not used. Screening and filtering are the physical technique being relied solely on	Membrane filtration, electrocoagulation

1.4 Electrocoagulation Fundamental Process

Electrocoagulation is one of the well-known wastewater treatment technique which coagulates the sediments particles and ions by using electric current. The operating concept for electrocoagulation is based on coagulation, flotation and electrochemistry. By comparing to chemical coagulation, electrocoagulation is a more eco-friendly as this method does not require the adding of chemicals into the water. However, the capital and electricity cost of the operation is found to be impractically high for electrocoagulation system [7]

High absorption ability in electrocoagulation is an environmental-friendly process for treating wastewater with heavy metal (m) ions and toxic organics which is characterized by the in-situ generation of hydroxide flocs and coagulant [10]. The basic requirement for electrocoagulation process is dissolution of metal cations from the anode reactor with the simultaneous formation of hydroxyl ions and hydrogen gas at the cathode as shown in **Equation (1.1)** and **Equation (1.2)** [11].

1.5 Solar Power System

The location of Sarawak is on the north of the Equator which lies between 0° 50' and 5°N latitude and longitude of 109° 36' and 115° 40' E. The state approximate total length is 800 km with an area covering 124,449.51 square kilometers along the northwest coast of Borneo [12]. Sarawak location of being near to the equator where the sun's ray intensity is at its peak giving much more solar radiation than poles make its the strategic place for instalment of solar power system. According to Malaysia Energy Centre's (PTM) technical adviser Tan Sri Vincent Tan, there was a lot of potential to develop solar power system in Sarawak where the sky is clearer in Southern Sarawak as it is nearer to the equator while the best time for solar harvesting is between 1 pm and 2 pm when the sun is at its peak [13, 14]. The measurement of solar power harvesting on a specified location is called solar irradiance. There are several factors to be considered on this solar irradiance as it varies throughout the year on different seasons depending on the position of the sun in the sky and the weather [15]. **Figure 1.3** shows an annual average solar radiation (Mj per sq. m) across Sarawak [16].
