DECLARATION OF ORIGINAL WORK

This declaration is made on the 30th day of June 2022.

Student's Declaration:

I ENYLINE ANAK BUJANG (65887), hereby declare that the work entitled APPLICATION OF A DEMAND CONTROL VENTILATION AT CITDS BUILDING FOR ENERGY SAVING AND INDOOR AIR QUALITY CONTROL is my original work. I have not copied from any other students' work or from any other sources except where due reference or acknowledgement is made explicitly in the text, nor has any part been written for me by another person.

30th June 2022

Date Submitted

ENYLINE ANAK BUJANG (65887)

Name of student (Matric No.)

Supervisor's Declaration:

I IR DR MOHAMAD ASRUL BIN MUSTAPHA hereby certifies that the work entitled APPLICATION OF A DEMAND CONTROL VENTILATION AT CITDS BUILDING FOR ENERGY SAVING AND INDOOR AIR QUALITY CONTROL was prepared by the above named student, and was submitted to the "FACULTY" as a * partial/full fulfillment for the conferment of BACHELOR OF ENGINEERING WITH HONOURS (CHEMICAL ENGINEERING), and the aforementioned work, to the best of my knowledge, is the said student's work.

Received for examination by: MOHAMAD ASRUL BIN MUSTAPHA Date: 30th June 2022
(Name of coordinator)

I declare this Project/Thesis is classified as (Please tick (√)):

<input type="checkbox"/>
<input type="checkbox"/>
<input checked="" type="checkbox"/>

CONFIDENTIAL (Contains confidential information under the Official Secret Act 1972) *

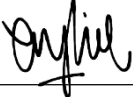

RESTRICTED (Contains restricted information as specified by the organization where research is done)

OPEN ACCESS

Validation of Project/Thesis

I therefore duly affirmed with free consent and willingness declared that this said Project/Thesis shall be placed officially in the Centre for Academic Information Services with the abiding interest and rights as follows:

- This Project/Thesis is the sole legal property of Universiti Malaysia Sarawak (UNIMAS).
- The Centre for Academic Information Services has the lawful right to make copies for the purpose of academic and research only and not for other purposes.
- The Centre for Academic Information Services has the lawful right to digitize the content to for the Local Content Database.
- The Centre for Academic Information Services has the lawful right to make copies of the Project/Thesis for academic exchange between Higher Learning Institute.
- No dispute or any claim shall arise from the student itself neither third party on this Project/Thesis once it becomes sole property UNIMAS.
- This Project/Thesis or any other material, data and information related to it shall not be distributed, published or disclosed to any party by the student except with UNIMAS permission.

Student' signature:

APPROVAL SHEET

This final year project report, which entitled **APPLICATION OF A DEMAND CONTROL VENTILATION AT CITDS BUILDING FOR ENERGY SAVING AND INDOOR AIR QUALITY CONTROL** was prepared by Enyline anak Bujang (65887) as a partial fulfillment for the Degree of Bachelor of Chemical Engineering is hereby read and approved by:

IR DR MOHAMAD ASRUL BIN MUSTAPHA

(Final Year Project Supervisor)

30th JUNE 2022

Date

APPLICATION OF A DEMAND CONTROL VENTILATION AT CITDS
BUILDING FOR ENERGY SAVING AND INDOOR AIR QUALITY
CONTROL

ENYLINE ANAK BUJANG

A dissertation submitted in partial fulfilment
of the requirement for the degree of
Bachelor of Engineering with (Hons)
Chemical Engineering

Faculty of Engineering
Universiti Malaysia Sarawak

2022

Dedicated to my parents, the late Mr Ahin Niece and Mdm Nyunyah Ngabek for the unconditional love, constant support and encouragement from the very first day.

ACKNOWLEDGEMENT

This endeavor would not have been possible without my final year project supervisor, Ir Dr Mohamad Asrul Mustapha, for all his generosity, guidance, and assistance in all aspects across this research. All the constructive criticism, commentary and recommendations given to me have made this research feasible and able to be completed in the given timeframe. My utmost gratitude and sincere thanks are dedicated to the respective examination panels, Ts Dr Josephine Lai Chang Hui and Associate Professor Dr Shanti Faridah for their goodwill, helpful opinions and fair critique which have guided me in further improving my dissertation. Coming across the research that is out of the ordinary from the rest of my course mates has truly been a major challenge to take on. Yet, their patronage and motivation have made this research clicks into place.

My sincerest appreciation is extended to the astonishing staffs in the CITDS building for their willingness and participations in the questionnaire that helps me acquire the necessary data for my research work, thus ensuring the smooth flow of my dissertation journey. Heartful thanks are expressed to the very few, quality close friends who have stuck with me since the beginning, providing comfort, company, encouragement, and genuine friendship. Special thanks are also dedicated to all individuals who had contributed, given full support and cooperation throughout this journey, without which accomplishing this dissertation would not have been possible.

I am forever indebted to my parents, the late Mr Ahin anak Niece and Mdm Nyunyah anak Ngabek for their endless support and love. They have always believed that education holds the power to cultivate an individual's life and that it does not matter which university you go to, you will always achieve success if you put your heart into it. My late father has always wanted me to further my studies in UNIMAS but heartbreakingly, he is not given the opportunity to share this moment for he is in a better place to be with the Lord. All I hope is that I am making you proud as I try to fulfill your wish of me and that this undergraduate thesis is dedicated to you, dad. Thank you for being the pillar of my strength and the best support system that a child could ever ask for.

Finally, I would like to acknowledge myself, for executing all the hard work while having no day off and never actually quitting despite the constant challenges that may arise. I would like to thank myself for all the sleepless nights and for always believing in my own capability.

ABSTRACT

Excessive usage of heating, ventilation and air-conditioning (HVAC) systems in buildings without proper mitigation contributes to incredibly high energy consumption in buildings, while emitting outrageous amounts of greenhouse gas (GHG) to the atmosphere. Besides, the GHG emissions subsequently promote adverse health effects on human being. On the other hand, the building occupants would be badly affected due to poor indoor air quality (IAQ), and the excessive usage of HVAC system since it is not designed to fulfil the requirements of thermal comfort of building occupants. An office building, for example, consumes high energy due to the HVAC system, which offers the opportunity to be studied. Therefore, an office located at the Centre for Information Technology (IT) Development and Services, CITDS, UNIMAS was chosen as the case study. Demand control ventilation (DCV) system has been proposed to be applied to the existing HVAC system by utilising Carrier's HAP simulation software. Carrier HAP is well known for its great advantages, especially in designing ventilation and DCV system into the existing HVAC system either for industrial or commercial buildings. The simulation was conducted with in depth analysis in compliance with the objectives. Result shows that the application of the DCV system feasibly reduced precisely 42.81% of the overall energy consumption and GHG emissions to the atmosphere whilst complying with the recommended limit set by ANSI/ASHRAE Standard 62 for indoor air quality control. In this regard, the DCV system application is efficiently designed for the CITDS building HVAC system. Correspondingly, it is discovered that optimum thermal comfort is obtained while simultaneously satisfying the recommended range and limit recommended by MS:1525.

Keywords: *Demand control ventilation (DCV), indoor air quality (IAQ), thermal comfort, Carrier's HAP, CITDS UNIMAS.*

ABSTRAK

Penggunaan sistem HVAC yang berlebihan di dalam sesebuah bangunan tanpa pelan mitigasi yang bersesuaian telah menyumbang kepada penggunaan tenaga yang sangat tinggi dalam sesebuah bangunan tersebut, pada masa yang sama turut mengeluarkan sejumlah gas rumah hijau (GHG) yang besar ke udara. Selain itu, pelepasan GHG kemudiannya menggalakkan kesan kesihatan yang buruk terhadap manusia. Sebaliknya, penghuni bangunan akan terjejas teruk kerana kualiti udara dalaman (IAQ) yang rendah serta penggunaan sistem HVAC yang berlebihan kerana ia tidak dirancang untuk memenuhi keperluan keselesaan haba penghuni bangunan. Bangunan pejabat contohnya, menggunakan tenaga yang tinggi kerana sistem HVAC, telah menawarkan peluang untuk dikaji. Oleh itu, sebuah pejabat yang terletak di Pusat Pembangunan dan Perkhidmatan Teknologi Maklumat, CITDS, UNIMAS telah dipilih sebagai skop kajian. Sistem pengudaraan kawalan permintaan (DCV) telah dicadangkan untuk digunakan pada sistem HVAC yang sedia ada dengan menggunakan perisian simulasi Carrier's HAP. Carrier HAP terkenal dengan kelebihannya yang mampu mereka bentuk pengudaraan dan sistem DCV ke dalam sistem HVAC sedia ada, sama ada untuk bangunan perindustrian ataupun komersial. Simulasi ini dijalankan dengan analisis yang mendalam demi mematuhi objektif kajian. Keputusan menunjukkan bahawa penggunaan sistem DCV telah berjaya menurunkan sebanyak 42.81% keseluruhan penggunaan tenaga elektrik serta pelepasan GHG ke atmosfera sambil mematuhi had yang ditetapkan oleh ANSI/ASHRAE Standard 62 untuk kawalan kualiti udara dalaman. Dalam hal ini, aplikasi sistem DCV direka dengan cekap untuk sistem HVAC bangunan CITDS. Sehubungan dengan itu, didapati bahawa keselesaan haba optimum diperolehi dan pada masa yang sama berjaya memenuhi julat dan had yang disyorkan oleh MS:1525.

Kata kunci: *pengudaraan kawalan permintaan (DCV), kualiti udara dalaman (IAQ), keselesaan haba, Carrier's HAP, CITDS UNIMAS.*

CHAPTER 1

INTRODUCTION

1.1 Research Background

Rapid urbanization following the significant growth and development in the third world countries and developed countries all around the world has increased environmental concerns such as global warming, climate change, ozone layer depletion, and air pollution. It is common knowledge that air pollution is harmful to human health. This is mainly due to various pollutants being discharged into the ambient air, leading to both outdoor and indoor pollution. One of the fundamental necessities for human health and fitness is respiring clean air. Although distinctive cleaner technologies have been established in industries, energy production and transport, air pollution issue continues to become a major health risk. The air pollution issues exhibit a pessimistic impact on human health for over 40 years which concerns the World Health Organization (World Health Organization, 2000).

Tsui (2020) explains that although air quality has improved significantly for the past 50 years, it persists as one of the environmental concerns in massive population cities. Air pollution is contributed by various reasons ranging from human activities such as industrial activities and motor vehicles to natural occurrences like bush fires. By all means, this environmental issue affects health in a broad range when being exposed to it. Regardless of the fact that outdoor pollution remains distressed, Harrison (1997) has acknowledged in his study that there has been an increasing recognition that indoor air pollution may bring greater if not similar implications towards human health. Substantially, indoor air pollution can present as much or greater risk as outdoor pollution. Many contributing factors that lead to indoor air pollution and one of them is the outdoor air that enters a building. Indoor activities such as cooking and cleaning contributes just as much pollutants to Indoor Air Quality (IAQ).

In recent years, following the inevitable outbreak of the COVID-19 pandemic, people have spent most of their time indoors. In fact, about 60% to 90% of their time is

spent in various indoor environments or institutional buildings, according to a study by Al-Jeelani (2017), even way before the pandemic hits the entire world. It has been proven that poor indoor air quality may lead to various health problems occurring either in the short period of time or long period of time. Health problems, along with allergic reactions, respiratory problems, eye irritation, sinusitis, bronchitis and pneumonia are frequently associated with poor indoor air quality (IAQ, 2010). Therefore, it is critical to ensure that the IAQ is as clean as possible since it is an essential factor in occupant comfort and health, considering that most of time is spent indoors (Elbayoumi et al, 2018). On that account, it is fittingly appropriate to the main focus of research to control the indoor air quality by implementing a proper ventilation system such as demand control ventilation (DCV) that also helps in energy improvement as well as greenhouse gases (GHG) emissions reduction.

Bednarova (2016) stated that although the idea regarding ventilation and air quality were connected back in ancient time which further associates ventilation and health from as early as possible, there was no particular point in time as to when ventilation system was invented or utilized solely for ventilation purposes. Back in 1660, the word ‘ventilation’ originates from the Latin word, ‘ventilatio’ which means wind, which allegedly implied as a process to replace poor air in a confined space with fresh and clean air. According to Bednarova, David Boswell Reid was one of the most important and outstanding figures throughout the historical development of the ventilation system during the 1800s. He particularly specialized in the fire-driven technology up to near perfection and contributorily brought ventilation in entering the era of machines with steam-driven fans and systems similar to the current technologies. Bednarova (2016) also mentioned that Reid has come to a realization concerning the importance of the reciprocation amongst ventilation, indoor environment, and the building designs back in the days.

Ventilation allows outdoor air to enter and disseminates the air accordingly inside the building. Atkinson et al. (2009) explained that the main aim of ventilation within buildings is to supply healthy air for respiration by diluting the pollutants generated indoors and removing the pollutants outside. The ventilation rate, airflow direction and air dispersion are three essential factors of building ventilation. Poor indoor air quality results from good for nothing the inadequacy of proper ventilation rates. According to a study by Apte (2006), poor indoor air quality is closely related to insufficient ventilation

rates, leading to various health problems that are generally recognized as sick building syndrome (SBS) aside from causing discomfort and well-being. Numerous researches have proven that lower rates of sick leaves are result from higher ventilation rates in commercial buildings, according to Apte (2006). Hence, proper ventilation is essential in order to remove any airborne pollutants generated by various activities from both indoor and outdoor sources.

As important as ventilation system for buildings, too much or too little of anything is good for nothing. For instance, over ventilated buildings may bring little to no leverage to the occupants aside from energy wastage, whereas under-ventilated buildings may adversely affect the occupant (Apte, 2006). Among all the available technical approaches in today's market, DCV is the most suitable strategy for matching building ventilation rates to their occupancy. The reason for this is that DCV allows the system to control the airflow of outdoor air intake into the buildings accordingly based on the number of occupants demand, and at the same time, reduce fan energy consumption. DCV is designed on the basis of minimum per-occupant outdoor air intake rates simultaneously with the varying occupancy rates whilst supplying sufficient ventilation of occupied spaces as well as minimising the energy usage in thermal conditioning. In short, the primary goal of this research is to thoroughly study the application of DCV by studying the data and its efficacy through a simulation program called Carrier's Hourly Analysis Program (HAP) software.

1.2 Research Problems

Indoor air pollution that has been elaborately explained previously, may promote the dispersion of biological risk factors and cause thermohydrometric alterations within the confined space in buildings as mentioned by Balocco and Leoncini (2020). Therefore, it has become a top priority to prevent health risks issues caused by indoor environment pollution that it is necessary to advocate for the engagement of various efficient subjects and extensive approach in assessing indoor pollution, sustainability as well as the quality of indoor environments, especially for those that spends most time indoors such as office buildings (Balocco & Leoncini, 2020). Furthermore, multiple studies in Malaysia in regard to the IAQ, thermal comfort and SBS documented that this has been a common issue for buildings in Malaysia. However, there is no establishment on the obligatory

regulations on IAQ for office buildings until this very day. Conversely, regulations and standards were set throughout the last 10 years only for industrial building (Elbayoumi et al., 2018).

The rising population and development across the globe evidently led to an increase in energy demands, with construction sector as the major contributor to energy consumption. Thus, growing demand for housings as well as commercial buildings that is followed by an increase in energy demands exist as repercussions (Hassan et al., 2014). The energy consumption by buildings in Malaysia accounts for a rough total of 48% of the electricity being generated in the country, as mentioned by Hassan et al. (2014), thus rising an issue of apprehension over greenhouse gas emissions and carbon dioxide. According to ASI Controls (2014), the main contributors to high consumption of energy are lighting in addition to heating, ventilation, and air conditioning (HVAC) as such that 35% average of total building energy is consumed by HVAC system whereas about 11% of energy are utilized by lighting. Since these factors are all very crucial in ensuring a productive building environment to the occupants, it is essential to comprehend building efficiency designs as well as the methods that could be implemented in order to reduce energy consumption within the building (Quadrennial Technology Review, 2015). Nevertheless, the amount of energy consumed within a building varies depending on various factors such as mechanical equipment and lighting.

In a study by Domínguez et al. (2012), high air renewal rates with distinct filtration stages and constant flow are required to meet the current standards for indoor air quality in buildings. In conjunction, Ismail et al. (2010) has made significant discovery showing that 77% of the indoor air quality problems arises from insufficient ventilation supply into the facility in opposition to the number of air changes rate per occupant range 20 cfm per person. Moreover, thermal discomfort and moisture issues are risks that may occur indoor due to high humidity and high temperatures experienced within the building (Ismail et al., 2010). On the other hand, as claimed by Balocci and Leoncini (2020), current research discovered that existing office buildings consumes much higher energy compared to the recently constructed buildings. This may be due to the fact that the former buildings were not designed by considering the correct and appropriate ventilation system. Moreover, there are still limited literature that focuses on the application of DCV in an office building in terms of energy efficiency and reduction of GHG emissions. Additionally, insufficient studies are available to examine the DCV in building HVAC

system to improve IAQ and at the same time reduce energy consumption. Hence, a substantial principle of demand control is used to conserve energy and improve indoor air quality control in this particular research. The application of DCV requires further investigation in order to design a suitable DCV in an office building.

1.3 Research Questions

In light of the problem statements mentioned above, the research structure concentrates on the application of the DCV system implemented in an office building for the purpose of energy saving and air quality control, whereupon has bring forth the following research questions.

- i) How does the application of DCV help to improve energy efficiency and reduce GHG emissions?
- ii) How does DCV impact the ventilation rate of the HVAC system?
- iii) How does DCV impact the thermal comfort of occupants?

1.4 Aim and Objectives

On the basis of the research questions aforementioned, the main aim of this study is to study the application of demand control in an office building for energy saving and indoor air quality control by using a software called the Hourly Analysis Program (HAP) by Carrier. Thus, several objectives are identified and stated in the following in order to achieve the aim of this study.

- i) To investigate the application of demand control ventilation for IAQ control, energy efficiency improvement, and GHG emissions reduction.
- ii) To design demand control ventilation application for building HVAC system.
- iii) To analyse the thermal comfort impact from the utilization of demand control ventilation.

1.5 Scope of Study

The scope of the research is to design and simulate the demand control ventilation by using a software called the Carrier HAP, created by Carrier Global Corporation. The
