Performance-based Durability Specifications of Fly Ash Concrete for  
Chloride-induced Environment

Ir. Jamil Bin Matarul

A thesis submitted

In fulfillment of the requirements for the degree of Doctor of Philosophy

(Concrete Materials)

Faculty of Engineering  
UNIVERSITI MALAYSIA SARAWAK  
2023

## DECLARATION

I declare that the work in this thesis was carried out in accordance with the regulations of Universiti Malaysia Sarawak. Except where due acknowledgements have been made, the work is that of the author alone. The thesis has not been accepted for any degree and is not concurrently submitted in candidature of any other degree.

Signature

Name: Ir. Jamil Bin Matarul

Matric No.: 15010039

Faculty of Engineering

Universiti Malaysia Sarawak

Date : 15<sup>th</sup> October 2023

## ACKNOWLEDGEMENT

In the name of Allah, The Most Gracious and the Most Merciful, I would like to express my sincere gratitude to all those who helped me directly or indirectly in completing the research for attaining a degree of Doctor of Philosophy within the stipulated time.

First and foremost, I would like to express my heartfelt gratitude to Prof. Dr. Mohammad Abdul Mannan and Prof. Dr. Azmi Ibrahim for their willingness to provide me with guidance and advice in order for me to complete this research. Without their guidance and comments, this research would not be completed well on time.

Additionally, special thanks to the every important people in my life, especially my mother, who always been there for me for my entire life, pray for my success, and provide a moral support; my wives for their kindness, understanding, time, and moral support; and my children for taking their time to complete this study successfully.

Special thanks also to all the participants from UNIMAS, UiTM, CMS Concrete Products Sdn. Bhd., Local Consultants, Sejingkat Power Plant, Gobel Industry Sdn. Bhd. JPS Sarawak, JKR Sarawak, DBKU and all respondents who are willing to answer the survey questionnaires for cooperation, time and manpower to conduct the investigation. Without permission, guidance and expertise from them, the study will not be organised beautifully.

## ABSTRACT

Existing standard concrete practices under implementation of Standard Specifications for Building Works (SSBW) promptly altered from prescriptive specifications to Performance-based Durability Specifications (PBDS) as advocated by Eurocode 2. This study was carried out to overcome the chloride-induced attack problem on reinforced concrete (RC) structures settled under XS3 class exposure by utilising fly ash waste, producing non-destructive test (NDT) models and developing PBDS indicators model. The Taguchi Approach was used in this study with a combination of survey questionnaires, field investigation, experimental works and Statistical Product and Service Solutions (SPSS) modelling. The experimental work includes compressive strength (Cu), water absorption (WA), void of permeable voids (VPV) and ultrasonic pulse velocity (UPV) tests. Which, tested on three different grades of ready-mix concretes, as well as concrete blended with Class-F fly ash with a 10% percentage increment up to 60%. Experimental work revealed that the Class-F fly ash was optimised at 30%. NDT models as represented by equation correlations of  $Cu_1 = 31.699UPV_1 - 84.641$ ,  $Cu_2 = 30.998UPV_2 - 79.275$  and  $Cu_3 = 36.438UPV_3 - 100.337$ . Developed PBDS indicators model equation was  $WA = 0.843VPV - 0.078UPV + 0.104$ . Meanwhile, "EXCELLENT" concrete quality rating bounded to Quality Rating Durability Compliance (QRDC) indicator values for UPV, VPV, WA and Cu should be more than 4.5 km/s, less than 10%, less than 7% and at least 55 MPa, respectively. The outcome indicators were found provide a flexible interface for client, designer or decision maker to make an accurate decision based on concrete performance, environmental sustainability and public user's safety.

**Keywords:** Chloride-induced, fly ash, NDT models, performance-based

***Spesifikasi Ketahanan Konkrit Berasaskan Prestasi Disebabkan oleh Klorida Persekitaran***

***ABSTRAK***

*Amalan konkrit standard sedia ada di bawah pelaksanaan Spesifikasi Standard untuk Kerja Bangunan (SSBW) adalah perlu diubah daripada spesifikasi preskriptif kepada Spesifikasi Ketahanan Berasaskan Prestasi (PBDS) seperti yang dianjurkan oleh Eurocode 2. Kajian ini dijalankan untuk mengatasi masalah serangan akibat klorida pada tetulang struktur konkrit (RC) di bawah pendedahan kelas XS3 dengan menggunakan sisa abu terbang, menghasilkan model ujian tidak merosakkan (NDT) dan membangunkan model penunjuk PBDS. Kajian dilaksanakan dengan menggabungkan pendekatan Taguchi bersama soal selidik tinjauan, penyiasatan lapangan, kerja amali makmal dan pemodelan Penyelesaian Produk dan Perkhidmatan Statistik (SPSS). Kerja amali makmal termasuk kekuatan mampatan (Cu), penyerapan air (WA), lompong telap kosong (VPV) dan ujian halaju nadi ultrasonik (UPV). Diuji pada tiga gred konkrit berbeza siap campur yang diadun dengan abu terbang Kelas-F dengan peratusan penggantian sebanyak 10% hingga 60%. Kerja amali makmal mendedahkan bahawa abu terbang telah dioptimumkan pada 30%. Model NDT seperti yang diwakili oleh korelasi persamaan  $Cu1 = 31.699UPV1 - 84.641$ ,  $Cu2 = 30.998UPV2 - 79.275$  and  $Cu3 = 36.438UPV3 - 100.337$ . Persamaan model penunjuk PBDS ialah  $WA = 0.843VPV - 0.078UPV + 0.104$ . Sementara itu, penarafan kualiti konkrit "CEMERLANG" mengikut nilai penunjuk Pematuhan Ketahanan Penarafan Kualiti (QRDC) untuk UPV, VPV, WA dan Cu hendaklah masing-masing lebih daripada 4.5 km/s, kurang daripada 10%, kurang daripada 7% dan sekurang-kurangnya 55 MPa. Hasil kajian mendapati penunjuk penarafan kualiti konkrit yang dibangunkan adalah mudah diguna pakai oleh pelanggan, pereka bentuk atau pembuat keputusan untuk membuat keputusan*

*yang tepat berdasarkan prestasi konkrit, kelestarian alam sekitar dan keselamatan pengguna awam.*

***Kata kunci:*** *Kakistan-klorida, abu terbang, model NDT, berasaskan prestasi*
