**ABSTRACT**

The chemistry of aspirin and chalcone derivatives has been extensively studied and developed as one of the pharmaceutically important molecules. In this study, new aspirin-chalcone derivatives have been successfully synthesized and characterized via FTIR, 1H and 13C NMR spectroscopy. The antibacterial activities of synthesized compounds were investigated towards *Escherichia coli* ATCC 8739 via turbidimetric kinetic method. The newly synthesized aspirin-chalcone derivatives, however showed poor antibacterial activity against *E. coli* ATCC 8739 at the concentration of 50, 80 and 100 ppm. The effect of the molecular structure of the synthesized compounds on the antibacterial activity is discussed.

Keywords: Aspirin, chalcone, antimicrobial, *E. coli*

Aspirin is a well-known salicylate drug, which has been used as an analgesic and anti-inflammatory medication. Modifications of aspirin have been carried out widely and many aspirin derivatives were reported to show various biological activities such as antibacterial (Al-Bakri et al., 2009), antithrombic and antiplatelet (Lechi et al., 1996) and also anticancer properties (Lechi et al., 1996; Zheng et al., 2007).

Our group has recently reported on the incorporation of aspirin with thiourea moiety with excellent antibacterial property against *E. coli* (Ngaini et al., 2012). Besides thiourea, chalcones which belong to the flavonoid family has also been identified as an interesting compound to display a diverse array of pharmacological activities. Chalcones show many biological properties including anticancer, antimalaria, antimicrobial, anti-inflammatory and antibacterial (Hsieh et al., 1998; Ram et al., 2000). Novel 2,4,2'-trihydroxy-5-methylchalcone, for instance, was reported to inhibit the growth of different Gram-positive bacteria (Sato et al., 1996).

This finding has stimulated our interest in the synthesis of a series of chalcone compounds containing aspirin moiety. In this paper, we report on the synthesis of aspirin-chalcone compounds 2a-b via incorporation of hydroxychalcone onto aspirin moiety. The hydroxychalcones 1a-b were earlier prepared via Claisen-Schmidt condensation prior to incorporation onto aspirin derivatives. The antibacterial property of the synthesized aspirin-chalcone derivatives were also studied against wild-typed *E. coli* ATCC8739.

Aspirin, oxalyl chloride, 4-hydroxybenzaldehyde, acetophenone, benzaldehyde and 4-hydroxyacetophenone were obtained from Merck and used without further purification. All the other reagents and solvents were used as received.

**Measurements:** Melting points were determined by the open tube capillary method and are uncorrected. Infrared (IR) spectra (ν/cm⁻¹) were recorded as KBr pellets on a Perkin Elmer 1605 FTIR spectrophotometer. 1H and 13C NMR spectra were recorded on a JEOL ECA 500 spectrometer at 300 MHz (1H)
