In the article titled “Unmet Supportive Care Needs among Breast Cancer Survivors of Community-Based Support Group in Kuching, Sarawak” [1], an incomplete version of Table 5 was incorrectly included. The complete version is shown in Table 5.

Accordingly, the sentence “Respondents with primary education level reported a significantly lower domain mean score compared to those with postsecondary or tertiary education level across the domains of physical and daily living (1.71 versus 2.19,  $p = 0.012$ ), sexuality (1.33 versus 1.95,  $p = 0.007$ ), patient care and support (1.76 versus 2.21,  $p = 0.014$ ), and health system and information (2.37 versus 3.00,  $p = 0.035$ )” in the Results section should be changed to “Respondents with primary education level reported a significantly lower domain mean score compared to those with postsecondary or tertiary education level across the domains of psychological (1.71 versus 2.19,  $p = 0.012$ ), sexuality (1.33 versus 1.95,  $p = 0.007$ ), patient care and support (1.76 versus 2.21,  $p = 0.014$ ), and health system and information (2.37 versus 3.00,  $p = 0.035$ ).
