Abstract

The economy growth is always the attention focal point to all country. However, the economy growth impacts the protecting environment and vice-versa. The contradiction between the environment and the development of economy are getting more serious. The low carbon economy should be one of the future choice for sustainable development. This study attempts to examine the reduction of carbon dioxide (CO₂) emission through different scenarios of economic growth and renewable energy mixed. There are three scenarios developed, namely Business-As-Usual (BAU), Ambitious 1 (AMB 1) and Ambitious 2 (AMB 2). Scenario analysis method and Long-range Energy Alternatives Planning System (LEAP) model were employed in this study. The results show AMB 1 was the most ideal scenario to strike the balance between economic development and environmental sustainability. It is recommended that power generation sector should opt for more renewable energy such as biomass, solar pv and small hydropower. In addition, integration between government agency, suppliers' and consumers' were needed to achieve Malaysia's commitment to reduce carbon emission.

Keywords: Low Carbon Economy, Sustainable Development, Environment, Economic Growth, Carbon

Introduction

Low-carbon economy (LCE) was defined as an economy relied on low carbon power sources which release minimal greenhouse gas (GHG) into the air (Regions for Sustainable Change, 2013), but particularly referred to carbon dioxide (Levy, 2010). The power generation sector was regarded as
